Supervisory Patent Examiner, Art Unit 3772	Examiner, Art Unit 3772						

U.S. Patent and Trademark Office

First the examiner would like to point out that the amended claim 17 contains subject matter specifically, "the electrical current is being supplied to place the lockout device.." changes the scope of the invention and therefore raises new issues that would further require further consideration and/or search.

Second The applicant argues that Burns does not disclose a prevention device that prevents manual actual when in an inactive state and permits it only when in an active state, the applicant further goes on to argues that Burns does not meet the claim limitation of only be actualable when in an active state for example, when power is being supplied to the lockout device. The examiner disagrees with the applicant's argument. The fact that Burns reference recites "... during a dosing period, the controller will sense two actuations and then will lock up and prevent actuation of the inhalation device until a predetermined minimal time has elapsed." Implies that the device only actuatable when in an active state (dosing period) and prevents actuation when in an inactive state (non-dosing period). Since the controller is controlling the locking mechanism it is inherent that a cower is being supplied to the lock up device (see col.8 lines 23-31)
